DENGUE NS1

Test Name	Result	Biological Reference Interval	Sample
NS1 Antigen	Positive		
Method	Solid Phase Immunochromatography		
Note	<p>This test detects the presence of Dengue NS1 antigen & IgM, IgG antibodies to dengue virus and should not be used as sole criteria for diagnosis of dengue infection.</p> <p>In early infections and some secondary infections, detectable levels of IgM antibodies may be low.</p> <p>Some patients may not produce detectable levels of antibody within the first 7 to 10 days after infection.</p> <p>If the test result is negative and clinical symptoms persist, additional followup testing using other clinical methods is recommended. A negative result at any time does not preclude the possibility of an early infection of Dengue virus.</p> <p>This is only a screening test. Therefore, isolation of virus, antigen detection in fixed tissues, RT-PCR and serological test like hemagglutination inhibition test, more specific alternative diagnosis method must be used in order to obtain a confirmation of dengue virus infection.</p>
